

Type Conversion

Emplicit Vs Explicit

Emplicit

```
In [5]: #Emplicit
print(5+8.7, '\n',
      type(5), '\n',
      type(8.7))

13.7
<class 'int'>
<class 'float'>
```

∴ In Emplicit auto detect the type of value then executed.

Explicit

```
In [7]: # Explicit programmer convert that type in to likely type:
print(int('4'))

4
<class 'int'>
```

```
In [8]: print(float(5)) # We know 5 is a int value.

4
```

```
In [10]: print(str(5)) # We know 5 is a int value.

5
<class 'str'>
```

Literals

Might you aware about what is Variables?

Literals is what things you store in the that perticular variable called Literls.

Thank you!
